Summary

My research focuses on memory architectures for large language models, with the goal of decoupling knowledge storage from reasoning capabilities and enabling models to continually acquire, retain, and update knowledge. I develop scalable, modular parametric memories that can be trained independently and integrated with modern LLM backbones. My work covers pretraining, supervised fine-tuning, large-scale data pipelines, and inference systems. Most recently, I led the research and development of *Intern-S2-Preview*'s memory architecture for continual domain expansion.

Education

Shanghai Jiao Tong University, Shanghai, China — Sept. 2025 – Jun. 2030
Ph.D. in Computer Science and Technology
Advisor: Prof. **Zhouhan Lin** (LUMIA Group)

Shanghai Jiao Tong University, Shanghai, China — Sept. 2021 – Jun. 2025
B.S. in Computer Science and Technology

  NeurIPS 2025.

[*]Equal contribution.

Research Experience

LLM Research Intern, Shanghai AI Lab — Aug. 2025 – Present

- Led research and development of *Intern-S2-Preview*'s memory architecture, including model training and production deployment, to support continual domain expansion through independently trained, plug-and-play memories.
- Developed supporting infrastructure, including vLLM-based inference adaptation and optimization, large-scale data pipelines, and retrieval components for new LLM architectures.

Research Assistant, DDST Lab, Shanghai Jiao Tong University — May. 2023 – Nov. 2023

- Developed DebugPilot, an interactive debugging system that automates error diagnosis and debugging procedure generation using program analysis and probabilistic modeling.

Honors and Awards

Second Place, RoboCup China Open, Small Size League, 2024
Third Prize, Prototype System Competition, CCF ChinaSoft, 2023
First Prize (Provincial), Senior Division, National Olympiad in Informatics in Provinces (NOIP), 2018
